Forecast completed.

Forecast Results by Model

No model ranking is performed. Readiness tiers reflect certification eligibility and backtest strength only.

Certification requires a minimum of 36 observations. Below 36, models may still run, but readiness is marked Ineligible.

Primary Ensemble | Tier 4 — Structural Failure

Decision Readiness

Readiness Tier

Tier 4 — Structural Failure

Certification requires a minimum of 36 observations. Below 36, models may still run, but readiness is marked Ineligible.

Confidence Posture

Low Confidence — Elevated Risk

Risk Flags: Error exceeds naïve baseline, Confidence interval materially miscalibrated, Confidence band structural failure

Exercise caution in executive decisions.

Executive Assessment Narrative

Summary: Primary Ensemble is assessed as **Low Confidence — Elevated Risk confidence** for decision use. This posture is based on observed accuracy, uncertainty calibration, and structural diagnostics.

Key Insights

- Observed forecast accuracy reflects an average error of 13.8% (MAE 410,480, RMSE 500,076).
- No material systematic forecast bias detected.
- Confidence interval calibration is unavailable or inconclusive.
- No material evidence of recent structural instability detected.

Use cautiously. Intended for exploratory analysis, stress-testing, or as a secondary reference only.

Risk Flags: Error exceeds naïve baseline, Confidence interval materially miscalibrated, Confidence band structural failure
