Sentinel Decision Intelligence

Sentinel is a continuous decision-intelligence monitoring system designed to support — **not replace** — executive judgment.

It exists to surface risk, uncertainty, volatility, and signal deviation *before* decisions are made.

What Sentinel *Is*

- A continuous monitoring and signal-detection layer
- A risk-first intelligence system
- A confidence and uncertainty interpreter
- A governance-aware analytical companion
- A system designed to **inform**, not persuade

What Sentinel *Is Not*

- A crystal ball
- An autonomous decision-maker
- A guarantee engine
- A black-box AI
- A replacement for executive accountability

Sentinel does not decide.
Sentinel does not promise.
Sentinel protects judgment — it does not replace it.

Sentinel Orientation

▶ Play

An executive briefing explaining how Sentinel works — and what it does not do.

Mute

When you are ready, proceed to the Sentinel interface below.

Dataset Commit

Data Commit Guidance

Your data has been committed.

Sentinel will now evaluate patterns, stability, and uncertainty based on the data provided.

Forecast quality depends on data completeness, consistency, and relevance.

Sentinel will highlight signals and risk — interpretation and decisions remain yours.

▶ Play

Guidance on what happens after data is committed and how responsibility applies.

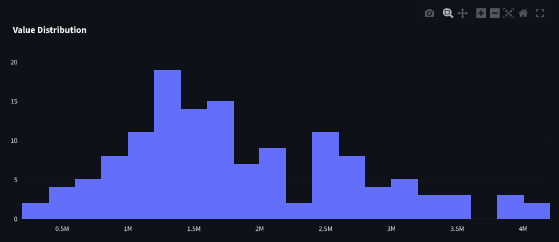
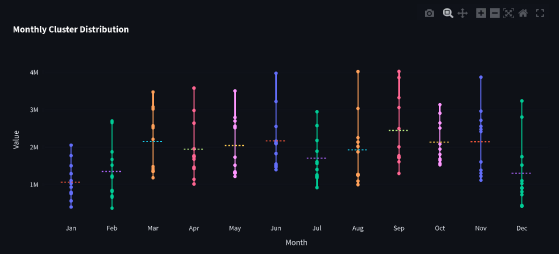
Each solid line represents a calendar year. Dotted lines are per-year linear trends and can be toggled via the legend.



Reveals dispersion, skew, and volatility in the committed data.



Each cluster represents all observations for a given month. Thin lines connect values chronologically; dotted lines show monthly means.

Scenario

Select scenario

Baseline

Executive Outlook & Intent

Capture your current macro assumptions. These inputs inform scenario stress, risk posture, and executive decision framing.

Macro environment you are planning for:

- Baseline / Business as usual
- Recession
- Growth acceleration
- External shock

Recession severity:

Moderate recession

Expected duration of this environment:

Short (≤ 2 quarters)

Confidence in this outlook:

High confidence

Economic Stress Signals

Qualitative signals currently observed.

Credit conditions

low medium high

Demand

low medium high

Employment

low medium high

Interest rates

low medium high

Organizational risk posture:

Aggressive (lean in)

Executive intent captured and applied.

Forecast Interpretation

This forecast represents a **range of possible outcomes**, not a single prediction.

Confidence intervals reflect **uncertainty**, not error.

Focus on **direction, variability, and risk** — not point precision.

Sentinel highlights what deserves attention, not what must be believed.

▸ Play

Guidance on how to interpret forecast results, confidence, and risk.

Scenario Audit

Audit record for **Baseline** (type: identity, created: Unknown)

	Parameter	Value
0	scenario_id	baseline
1	transform	identity
2	intent_modifiers	{'severity': 1.0, 'duration': 1.0, 'posture': 1.0}

Scenario Description

Unmodified engine forecast (source of truth).

Scenario Impact Summary

Unmodified engine forecast (source of truth).

Baseline introduces a **positive impact** over the forecast horizon, changing cumulative expectations by **0.0%** relative to baseline.

Cumulative Δ vs Baseline

0

Worst Point Impact

0

Best Point Impact

0

Actual vs Forecast (Row-Level)

Comparison of committed actuals against the selected forecast model (Auto-Blend). Errors are computed where dates overlap.

	date	actual	forecast	error	abs_error	pct_error	lower	upper

Executive Decision Verdict

Decision

PROCEED WITH CAUTION

Risk Posture

Executive-Capped Risk

Scenario Downside

0.0%

Model Confidence

75.5%

Decision context: **Baseline**

Trend signal: Flat / Down

Executive guidance: Proceed as planned. Standard monitoring applies.

Executive intent applied: Moderate recession selected — caution enforced.

Executive Auto-Intelligence

Interpretive guidance explaining how forecast math, scenario stress, and executive intent combined to produce the final verdict.

Executive Intent Overrides Mathematical Outlook

The selected recession scenario introduces caution despite limited mathematical downside in the forecast.

Recommendation:
This outcome reflects executive risk framing rather than forecast stress. Consider validating recession assumptions against incoming data.

Confidence: 75%

Details

Verdict Capped by Recession Severity Selection

A moderate recession was selected, which limits upside verdicts even when forecast performance remains resilient.

Recommendation:
If confidence in recession severity decreases, re-run scenarios with adjusted assumptions to reassess upside potential.

Confidence: 85%
